# PROPELLERS

#### Where the Power Meets the Water!

Choosing the right propeller is the single most important decision you can make to get the best performance from your boat and outboard!

Propeller choice can affect boat top speed by as much as 5 to 10 MPH. It also has a direct effect on acceleration, cornering, pulling power, and fuel economy.

With some boats, you may need to change propellers for different activities, such as high speed cruising, water skiing, or carrying heavy loads. Using the wrong propeller in any of these applications will not only hurt performance, but could also cause engine damage.

#### Basic Propeller Terms

- Leading Edge: The edge of the blade closest to the boat.
- **Trailing Edge:** The edge of the blade farthest from the boat.
- Blade Tip: The point on the blade farthest from the hub. It separates the leading edge from the trailing edge.
- Blade Root: The area where the blade attaches to the hub.
- **Blade Back:** The side of the blade closest to the boat (low pressure side).
- **Blade Face:** The side of the blade opposite to the boat (high pressure side).

#### How Does a Propeller Work?

A propeller is a set of identical twisted blades, spaced evenly around a hub. Most propellers have a splined bushing in the hub that mounts on the outboard. The bushing attaches to the propeller with flexible rubber that acts like a shock absorber. If the propeller strikes something hard, the rubber helps protect against damage.

Newer propellers may use a multi-piece interchangeable hub system. Refer to Propeller Hub systems on Page 10.

Each propeller blade has two surfaces that displace water to move the boat. As the propeller rotates, the blade back creates a low pressure that helps pull the boat forward.

The blade face creates high pressure as it rotates. This pressure forces a stream of water away from the propeller. As the water is pushed to the rear, an equal force pushes the boat forward.

#### What to Consider When Shopping for a Propeller

Several characteristics affect how a propeller will perform. Especially important are propeller diameter, pitch, rake, and cup. Most propellers are identified by their diameter and pitch. Look for a number like 14<sup>3</sup>/<sub>4</sub> X 21. The first number is the diameter, the second is the pitch.

In addition, it is important to understand the effects of ventilation, cavitation, materials, and other application variables on propeller performance.

**Diameter** is the width of the circle described by the tips of the rotating blades.

Propeller diameter determines the amount of power a propeller can apply to the water—how much load the propeller can push. Generally, heavy loads require larger diameter propellers while small, fast boats are more efficient with a smaller diameter.

However, diameter is not usually a critical option when choosing a propeller. Focus instead on propeller style and pitch.

**Pitch** is the theoretical distance a propeller will travel in one complete revolution. For example, a  $14\frac{3}{4}$  X 21 propeller would ideally move 21 inches forward with each revolution. In practice, the actual distance travelled is less than the pitch because of "slip" which is necessary to produce thrust.

Lower pitched propellers are like the lower gears on a car or bicycle. They create less forward travel with each revolution. A low pitch allows engine RPM to build up quickly, which gives faster acceleration and more pulling power. This works well for heavy loads, but results in slower top speeds.

Higher pitched propellers are similar to high gears. They create

more forward travel with each revolution. A high pitch puts more load on the engine, which reduces low speed pulling power and acceleration, but usually provides more top speed.

**Rake** is the angle the blade tip tilts away from the gearcase. The angle is measured on a line extending from the center of the hub through the center of the blade. Rake can be either flat or progressive. Progressive rake means that the rake angle increases with distance from the hub.

Most propellers have between 0° and 20° rake.

High rake propellers tend to lift the bow of the boat. On fast, lightweight, V-bottom boats, a high rake propeller should increase speed by reducing the amount of wetted hull surface.

When operated partially surfacing, high rake propellers reduce

the amount of water being thrown off the blade by centrifugal force as the blade leaves the water. This allows high rake propellers to work more effectively in these applications.

Tunnel boats and other air entrapment type hulls may become unstable when using a high rake propeller. In these applications, a propeller with less bow lift would be a more appropriate selection.

#### What to Consider When Shopping for a Propeller

**Cup** is the small curved lip added to the edges of some propellers. Cupping acts like a seal on the edge of the blade. It keeps water on the high pressure blade face from flowing around the trailing edge to the low pressure area on the blade back. This reduces ventilation and slipping, especially when operating in disturbed or aerated water.

Propellers with cup excel in sharp turns and applications where the engine is mounted higher than normal. Cupping also allows the outboard to be trimmed higher for more bow lift.

Cupping the tips of the blades increases the effective rake, adding to the bow lift capabilities of the propeller. Adding cup to the trailing edge of the blades has the effect of increasing pitch. As a result, you can expect a slight loss of engine speed (150-300 RPM) when cup is added. However, the additional cup may allow the propeller to work at a higher transom height. Raising the motor will reduce drag on the gearcase and will often recover the engine speed.

**Ventilation** is the result of air bubbles from surface air or exhaust gases being drawn into the blades. These pockets of air make a propeller lose its bite or thrust. Your RPM may climb wildly, yet you may not gain or lose speed. This is most common with high transom mountings, extreme trim settings, or sharp turns.

To help prevent ventilation, the outboard has an anti-ventilation plate directly above the propeller. For most applications, this plate should be within an inch above or below the bottom of the boat. On a high-performance boat, this rule does not necessarily apply. The anti-ventilation plate may be several inches above the boat bottom.

Water testing is the best way to determine the correct engine mounting height.

Cupped or high performance propellers help minimize ventilation.

**Cavitation** is caused by a disturbance of the water flow in front of the propeller. An irregularity in the boat bottom or gearcase, a misplaced transducer or speedometer pickup, or even a loose rivet can cause this problem.

Cavitation begins when a disturbance creates a low-pressure area in the water flow. As speed increases, the low pressure intensifies enough to vaporize (boil) some of the surrounding water. When the vapor bubbles approach a high pressure area, they collapse, releasing energy and causing damage.

The results of cavitation usually appear as burned areas on the gearcase or propeller blades. If the damage is substantial, performance is lost and the propeller should be replaced. In addition, the cause of the disturbance should be repaired to prevent further problems.

**AIR BUBBLES** 

**Material**—Aluminum propellers provide a good balance of cost, performance, and durability for most applications.

Stainless steel propellers offer improved performance, fuel economy, and durability. Because stainless steel is five times stronger than aluminum, it is much less susceptible to damage from striking underwater objects.

However, the main advantage of stainless steel is in performance. Because of its strength, stainless propeller blades can be cast much thinner, which reduces drag. Stainless steel blades are also stiffer, which increases efficiency.

Composite and plastic propellers are generally used for emergency situations.

**Blade Count**—Theoretically, the fewer number of blades a propeller has, the more efficient it will be. But as the number of blades is increased, vibration is decreased. For most applications, three blade propellers provide the best balance between efficiency and smoothness.

However, *BRP/Evinrude* engineers have created a series of four blade propellers that provide increased efficiency and a superior grip on the water. The result is improved acceleration and better cornering in all water conditions.

In addition, when operated in a surfacing application, a four blade propeller keeps more blades in the water for maximum thrust and efficiency.

**Rotation**—Right-hand propellers are considered standard rotation propellers. To move the boat forward, the propeller rotates in a right-hand (clockwise) direction as viewed from the rear.

Left-hand propellers are considered counter-rotation propellers. To move the boat forward, the propeller rotates in a left-hand (counterclockwise) direction as viewed from the rear. Left-hand propellers must ONLY be used on an outboard equipped with a counter-rotation gearcase.

In a dual-outboard installation, the use of both right-hand and left-hand propellers balances the torque created by the rotation of the propellers. This helps to reduce the effort needed in steering and also helps to keep the boat level from side to side.

# WARNING

For dual-outboard installations, always check to be sure propellers are installed on the correct engines before aggressively operating the boat.

#### Matching the Right Propeller to Your Boat and Outboard

**Step One:** Choose the propeller type designed for the way the boat will be used:

- Fishing, skiing, cruising, commercial, racing, etc?
- · How many people will be on board?
- Is the water shallow, or are there rocks or other underwater objects?
- Will the boat be used for multiple purposes?

Use the propeller family descriptions in the following pages as a guide. For example, a Rebel<sup>™</sup> propeller could be a good choice for a large, offshore boat. In contrast, a Raker<sup>®</sup> propeller provides bow lift, for increased top speed, on small, fast boats.

Step Two: Find the correct sized propeller for your specific outboard, boat, and load combination.

When selecting a propeller, start with the propeller charts in the following pages. These charts group all of the propellers designed for a particular outboard and provide detailed information such as pitch, diameter, style, and the number of blades.

To complete the selection process, you must perform a water test. During this running test, you will determine the best combination of engine mounting height, propeller style, and propeller pitch.

All *Evinrude* and *Johnson* outboards have a recommended full throttle operating range. This means that, at full throttle, engine RPM must never be below or above this range. These specifications can be found in the **Operator's Guide**.

The propeller provides the load that controls engine RPM. Reducing propeller pitch size will increase engine RPM at full throttle. Increasing propeller pitch size will decrease engine RPM at full throttle.

You have the correct propeller pitch when the engine runs at the midpoint of the full throttle oper-

ating RPM range with the normal, expected load in the boat. This is usually the point of peak horsepower. Choosing the correct propeller pitch for a given boat and application will ensure long engine life, along with best overall fuel economy and performance. When you have a selection of propellers ready for testing:

- 1. Use an accurate tachometer to measure RPM and an accurate speedometer to measure boat speed.
- 2. Testing should be performed with the typical load—number of people, gear, water in live wells, etc.
- 3. Make sure that every test is with an identical setup.
- 4. Test each propeller at wide open throttle (WOT).
- 5. Engines should be tested at their optimum trim angle. This is the highest trim position the engine can be run without excessive ventilation, either in a straight line or in turns.
- 6. If the RPM is too low at WOT, try a reduced pitch and retest.
- 7. If the RPM is too high at WOT, test a propeller with more pitch. One pitch size usually results in a change of 200-300 RPM.
- 8. If the boat will be used for two applications, like water skiing and cruising, it may be necessary to test propellers for each type of use.

**Step Three:** Adjust the engine mounting height for peak performance.

The ideal engine mounting height provides the fastest boat speed without sacrificing acceleration, maneuverability, or engine water pressure. It is achieved by a trial and error method.

- 1. Start with the outboard's anti-ventilation plate even with the bottom of the boat.
- 2. Raise the outboard one mounting hole at a time until engine performance is no longer acceptable. Then, lower the outboard back down one hole.

Optimum engine height is affected by propeller style, diameter, and pitch. As you raise the engine, you may need to experiment with a variety of propellers to maximize performance.

#### Things to Remember

Check full throttle RPM often. It is possible that the propeller pitch size may have to change as the boating application or load changes.

- Adding or removing people can significantly change the power requirements placed on the engine.
- Changes in atmospheric pressure, temperature, and humidity all affect engine performance, which directly affects propeller performance.
- Salt water is more buoyant than fresh water; this may cause some hulls to run faster when moving from a fresh water to salt water location.
- The accumulation of marine growth or dirt—moss, barnacles, lime deposits, etc—is a major cause of poor boat performance.

#### Rebel<sup>™</sup> - Offshore and Cruising

The Rebel™ propeller is designed and engineered to deliver improved midrange cruising and top end performance on V6 Evinrude® E-TEC®. Large diameter and efficient blade contour provide faster speeds at lower RPMs to deliver significant improvement in fuel economy. Your customers will get more miles to the gallon and a longer cruising range. Standard rotation and counter rotation models are available from 15 to 25 inch pitch. Use the Rebel™ propeller on offshore boats, large runabouts, and even large pontoon boats to make them perform to their maximum potential.

- · High polish stainless steel
- · Designed and engineered for efficient midrange cruising
- · Improved fuel economy with longer cruising range
- · Use on offshore boats, large runabout, and pontoon boats.

#### Raker® & Raker II® - Bass and High Performance

Looking to plane fast - and run faster? The Raker II® prop is specially designed for building up engine RPMs and getting you on plane faster. A great prop in surfacing conditions, especially when the boat is running over 50 mph. Perfect for bass boats and high performance boats. The Raker® propeller utilizes vent holes in the outer exhaust hub to allow exhaust gases to ventilate the blade area. This allows the engine to build up RPMs and get the boat on plane faster. At higher speeds, the water rushing past the hub blocks these vent holes, preventing them from ventilating the blades. V6 Raker II® 22, 24, 26, & 28 use the TBX™ hub system. • Fast, Fast, Fast..

- · Fast, Fast, Fast...
- Custom cupped high rake blades provide superior bow lift and exceptional top end speed
- Special vent holes for powerful acceleration
- V4 & V6 engines

#### Cyclone<sup>™</sup> - 4-Blade Offshore Cruising and Runabouts

When you need a prop that can hold course straight and true in all water conditions, trust the Cyclone<sup>™</sup> prop to maintain compass headings and stay hooked up in big water. Designed for heavier and twin-engine boats as well as runabouts. Cyclone<sup>™</sup> uses the TBX<sup>™</sup> hub system.

- · Ultimate performance 4-blade offshore and runabout propeller
- Stays on plane with minimum RPM
- · Tracks true in all water conditions
- · Less vibrations and improved fuel economy
- V6 engines

#### Viper<sup>™</sup> - Runabouts and General Recreation

If you want speed, you want the Viper<sup>™</sup> prop. It's longer swept blades and a larger diameter give this prop a better grip on the water faster acceleration, and greater top end speed. Excellent on any recreational boat, from runabouts and cruisers to deck boats.

- Versatile 3-blade performance
- · Custom high luster finish
- Balance of speed and durability
- V4 & V6 engines

#### Rogue™

The new Rogue™ propeller for the 20" shaft, 40 through 115 hp Evinrude® E-TEC® provides faster acceleration and faster top speeds in stern heavy boats. Flats boat operators will appreciate this propellers ability to lift the transom and accelerate cleaner in shallower water.

- Stainless steel 4-blade design
- · Polished, high luster finish
- · Carry a 3 year limited warranty
- Available in 13, 15, 17, 19, and 21 inch pitch sizes

# 0

#### SSP Prop - General Purpose and Durability

Since stainless steel is five times stronger than aluminum, the SSP can be designed and cast with thinner blades...blades that are cupped to provide better performance. This versatile prop is an ideal upgrade replacement for aluminum

This versatile prop is an ideal upgrade replacement for aluminum propellers and provides greater performance for water skiing. If a customer has an aluminum propeller, a "direct pitch" replacement (same pitch and diameter) is recommended when upgrading to an SSP.

- Fast planing 3-blade versatile prop
- Ideal upgrade from aluminum
- · Cupped blades provide superior performance

#### Hydrus® - Pontoon and Work Boats

A high-thrust prop designed and manufactured to meet the specific performance needs of pontoon boats and work boats. This three-blade prop provides an oversized blade area for maximum thrust and stability (it will keep its grip even when most of the weight is near the bow) and aggressive cupping for tight, balanced turning. The result? A high-thrust prop that bites the water and hangs on tight.

- · Aggressive cupping holds tight in turns
- Big blade area for high reverse thrust
- Special blade contour delivers maximum thrust in any water condition

## Evinrude®/Johnson® Aluminum<sup>™</sup> Props

More Performance for the Money! Evinrude®/Johnson® props are cast with a custom aluminum alloy to give them greater strength and longer life than ordinary propellers. Many of the Evinrude®/Johnson® outboards are speed cupped for better top end performance. Special baked-on corrosion-resistant paint gives added protection against salt water and galvanic corrosion.
 Precision casting provides greater strength and longer life

- Baked-on corrosion-resistant pant gives added protection
- Engineered to match the power curve of your outboard for superior performance

#### TBX<sup>™</sup> Propeller Hub System

For Evinrude®/Johnson® Introducing the TBX<sup>™</sup> Multiple Piece Propeller Hub System from Evinrude®/Johnson® Genuine Parts. The TBX<sup>™</sup> prop hub system adds a new level of durability and reliability to the Raker II®, Renegade® Bass, and Cyclone<sup>™</sup> propellers. TBX<sup>™</sup> is designed to flex and cushion shock loads to help protect the lower unit drivetrain. The patented torsion sleeve and drive spline withstand extreme temperatures especially in high performance applications.

A TBX<sup>TM</sup> prop hub kit comes with the propeller and the multi-piece design slips together keeping the installation simple. Replacement parts are available in kits or separately.

Look for the TBX™ designation in the V6 prop chart to determine availability.

TBX™ Propeller Hub Kit P/N 177283 for Evinrude®/Johnson® Outboards

#### **TBX™** Competitor Propeller Hub System

We DARE You to Try Our Props on Competitor Outboards! Our interchangeable TBX<sup>™</sup> hub kit is designed to fit Mercury®, Yamaha®, Honda®, and Suzuki® V6 outboard engines. This kit lets you install a Raker II® TBX<sup>™</sup>, Renegade® Bass TBX<sup>™</sup>, and Cyclone<sup>™</sup> TBX<sup>™</sup> propellers on competitor outboards.

This kit lets you install a Raker II® TBX™, Renegade® Bass TBX™, and Cyclone™ TBX™ propellers on competitor outboards. TBX™ Propeller Hub Kit P/N 177288 for competitor outboards available July 2009.

#### Aluminum Propeller Interchangeable V4 Hub System

For Evinrude®/Johnson® each propeller incudes a hub kit of P/N 765195 for a V4, fitting an Evinrude®/Johnson® outboard. Each hub kit includes the rubber torsion bushing, thrust washer, spacer and instructions. Accessory hub kits are required to install the propeller on competitive brands of engines. Select the accessory hub kit for competitive engines from the listing in this section.

#### Aluminum Propeller Interchangeable V6 Hub System

For Evinrude®/Johnson® each propeller incudes a hub kit of P/N 765190 for a V6, fitting an Evinrude®/Johnson® outboard. Each hub kit includes the rubber torsion bushing, thrust washer, spacer and instructions. Accessory hub kits are required to install the propeller on competitive brands of engines. Select the accessory hub kit for competitive engines from the listing in this section.

# Propeller Hub System - TBX™

#### Propeller Selection - Application/Boat Type Which Propeller is Right for You?

#### Application Chart, Propeller - Purpose of Use

| Propeller type and style            | Purpose of Application  |
|-------------------------------------|---|
| Aluminum - 3 blade                  | General purpose, good balance between cost and performance, lowest cost, good value, least durable  |
| Hydrus™ - 3 blade, aluminum         | Pontoon boats, work boats, high forward and reverse thrust, aggressive cupping to reduce ventilation in turns, 40 - 90 HP engine                            |
| SSP - 3 blade, stainless steel      | Upgrade from aluminum, general purpose, improved durability, cupped blades, limited pitch size  |
| Rogue™ - 4 blade, stainless steel   | Improved bite in turbulent / rough water, good transom lift, strong acceleration, cupped blades, minimize vibration and reduce slip, In-line and V4 engines |
| Raker® - 3 blade, stainless steel   | 60 mph plus, bass boats, bow lift, vent holes for strong acceleration, aggressive cupping to run elevated transom heights and high trim                     |
| Viper™ - 3 blade, stainless steel   | Most popular - general recreation use, good bow lift , strong acceleration and top speed over SSP, wide selection of pitch and rotation                     |
| Rebel™ - 3 blade, stainless steel   | Improved mid range fuel economy, strong acceleration, large diameter for greater thrust, cupped blades, V6 engines, bow heavy boats                         |
| Cyclone™ - 4 blade, stainless steel | Improved bite in turbulent / rough water, less vibration, transom lift, strong acceleration, cupped blades to reduce slip, V6 engines                       |

# THE WORLD IS OUR PLAYGROUND

Nothing is more valuable than the land and water we play on your playtime. That is why BRP is dedicated to continually finding new and better ways to help

you enjoy your favorite power sports. From snow to water to both on- and off-road fun, our passion for adventure fuels the

innovations that result in the ultimate power sports experience for our customers. We value

and are committed to protecting it. Our desire to thrill is paired

with an emphasis on rider responsibility, placing personal safety above all else. So that each outing can be the most enjoyable, memorable and

thrilling experience possible. Because your free time should always be your best time.
